

Protect your asphalt.

Which option would you prefer?

Option A

Hawk-Seal treatment after 1 year.

Penetrates into and strengthens the asphalt binder

The binder is the key!

Surface is waterproof & UV protected.

Surface cracks are sealed.

Pothole formation significantly reduced.

Surface life is significantly extended.

Maintenance costs are reduced.

Most surfaces will look & wear like a new overlay.

Hawk-Seal will penetrate through seal coats.

Because it penetrates, it is not worn off by traffic.

One treatment will last for years.

Option B

Seal coated surface after 1 year.

Seal coat applications do not penetrate asphalt.

Merely “painted” over the surface

Quickly worn off by traffic

Short-term cosmetic appearance rapidly disappears.

Surface is not waterproof or UV protected.

Asphalt is dried out and damaged.

Surface cracks are not sealed.

Spider cracks form in all seal coated surfaces.

Maintenance costs are increased.

Surface life is shortened.

Treatment lasts only days.

Invest a little money in your asphalt.

OR

Waste a lot of money on your asphalt.

**Hawk-Seal penetrates through existing seal coats!
All seal coated surfaces should be treated with Hawk-Seal.**

"I am convinced that Hawk-Seal is the best pavement sealer I have seen during my 30 years with the Federal Highway Administration as Research Engineer and Pavement Specialist and during my 8 years as a city engineer."

--- author of the FHWA's Hot-Mix Bituminous Paving Manual

Hawk-Seal is a true, asphalt maintenance treatment.
